

# **E-TEXTBOOK FOR MATHEMATICAL INQUIRY : DESIGN of ENGAGEMENTS & BOUNDARIES**

**Michal Yerushalmy  
with Elena Naftaliev**

Department of Mathematics Education  
University of Haifa, Israel  
[michalyr@edu.haifa.ac.il](mailto:michalyr@edu.haifa.ac.il)

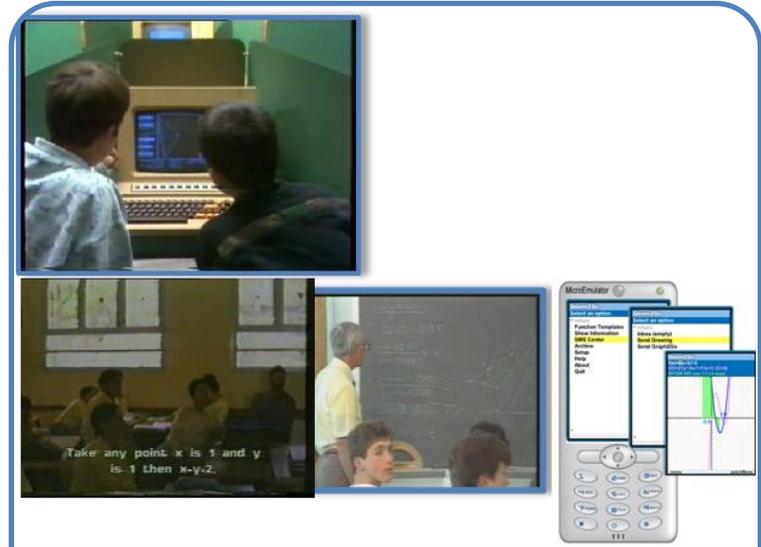

# Mathematical Inquiry

## Engagement with empirical and formal aspects

- [Having] a primitive conjecture
- Proof (a rough thought, experiment, an argument)
- Global counterexamples to the primitive conjecture
- Proof re-examined
- Primitive conjecture improved
- Consequences and counterexamples turn into examples of a new inquiry

- Rules, norms & Guidance
- A curate exhibition
- A few central objects
- Many galleries
- (Too) Many exhibits & exhibited items
- Do-It-Yourself stations

Museum Image

In the classroom

A "simple pattern of mathematical discovery"  
Lakatos Proofs & Refutations (p. 127)

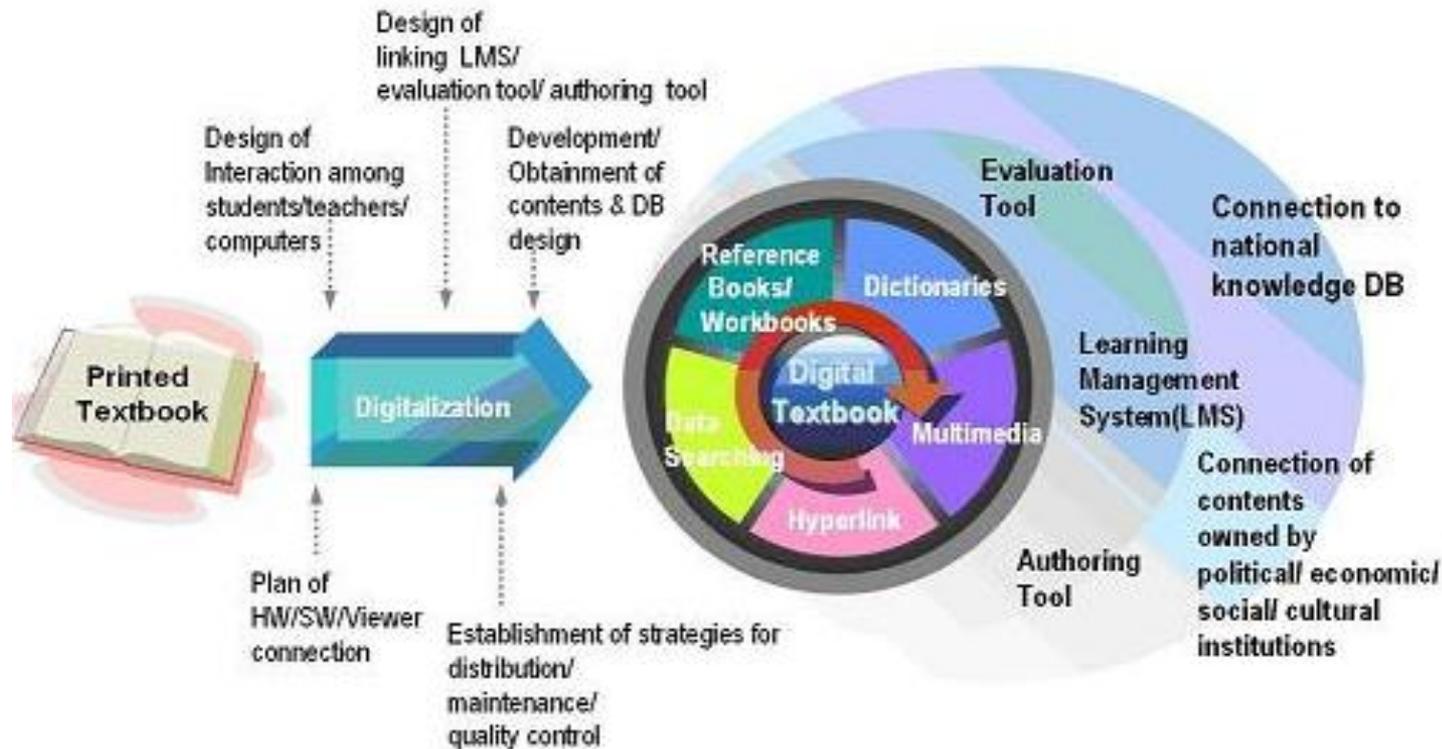

# Textbook Culture Characteristics

Love and Pimm's (1996) "text on texts"

- A textbook is a message from the professional community to students about what they should learn
- It also represents the ideas of the author about how the content should be taught and learned
- It plays a central role in school pedagogy and classroom norms, and its *authoritative image* has been the dominant aspect of the common classroom culture often identified as *textbook culture*
- **Textbooks are linear** and demand "linear textual flow of reading" (p. 381);
- Textbooks are closed -- have been **created in the past**
- Traditionally , it includes problems for exercising but **not aim at questioning the content**

# Multiple Resources is the key aspect of current eTextbooks

Source: Korea Education and Research Information Service (KERIS), 2007

# What's between “collection” & eTextbook?

My contribution aims at exploring design principles of Interactive textbook when *authored to be delivered* by technology (as opposed to *adopted for* technology)

- I would focus on the challenge of designing **non-sequential textbook** to turn by the teacher into instructional material
- I would zoom into the challenge of designing and analyzing **multimodal sequence** of interactive tasks
- A visual-semiotic framework has been developed to serve as the tool for analyzing students' learning with **interactive tasks**
- I would illustrate how this framework could serve designers and teachers
- Implications & Redesigning: questioning the stability of design principles

# Design Non-sequential Textbook

- The flexible structure and the features designed to create reader engagement challenge key functions of the textbooks as a complete presentation of “truth” ordered in the past into a single possible logical sequence
- I argue for the importance of
  - taking a view to mathematic subject matter
  - having tools reflecting this view making it transparent to the capacity to design textbook for inquiry curriculum

# Nonlinear texts: Designing for Engagement

Writing about the meanings of composition, Kress and van Leeuwen (The Grammar of Visual Design 1996) observed non-linear texts imposing paradigmatic

“They [texts] select the elements that can be viewed and present them according to a certain paradigmatic logic... but leave it to the reader to sequence and connect them”

<b>Linear Text</b>	<b>Non Linear Text</b>
“an exhibition in which the paintings are hung in long corridors through which the visitors must move, following signs, to eventually end up at the exit,”	“exhibition in a large room which visitors can traverse any way they like... It will not be random that a particular major sculpture is placed in the center of the room, or that a particular major painting has been hung on the wall opposite the entrance, to be noticed first by all visitors entering the room”

**“Linear and non-linear texts thus constitute two modes of reading and two regimes of control over meaning” (p. 223)**

TOOLS - Windows ...

**TOOLS**

- Representation of functions
- Representation of parametric families
- Representation of points
- Functions on intervals
- Function fitting
- Transformations
- Representation of comparisons
- Binary calculator
- From function to Change
- Spreadsheet

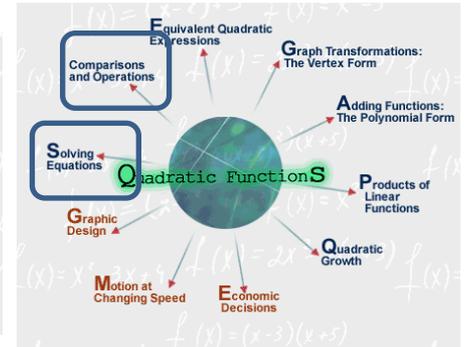

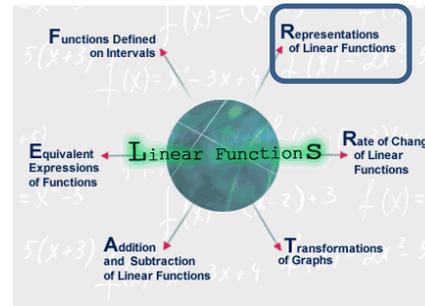

### List of Activities

The table lists the names of all the activities and a brief description of each.

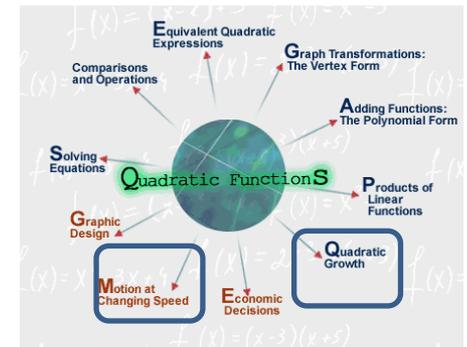

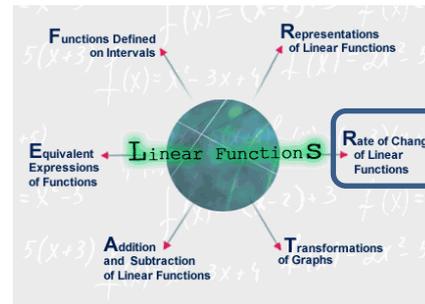

Linear Functions	
<a href="#">Representations of linear functions</a>	The relations between changes in one representation and another.
<a href="#">Rate of change of linear functions</a>	Expressing the rate of change of a function.
<a href="#">Transformations of graphs</a>	Operations that characterize families of functions.
<a href="#">Addition and subtraction of linear functions</a>	Arithmetic operation of functions. Relationship between those of the function and their graphs.
<a href="#">Equivalent expressions of functions</a>	Writing different ways of writing a function.
<a href="#">Functions defined on intervals</a>	Functions that behave differently on different intervals.
Quadratic Functions	
<a href="#">Equivalent quadratic expressions</a>	Switching between different ways of writing a quadratic function.
<a href="#">Graph transformations: the vertex form</a>	Operations that characterize families of functions.
<a href="#">Adding functions: the polynomial form</a>	Addition of functions.
<a href="#">Function fitting</a>	Use this tool to fit a linear or quadratic function to a collection of ordered pairs and points that represent them. Functions are represented by means of correspondence rules, value tables, and graphs.
<a href="#">Representation of comparisons</a>	Use this tool to write expressions of two functions and an equality sign between them (equality and different types of inequality), to obtain their graphic representations and value tables, and to view the solution in both representations. When you pass the mouse over the horizontal line that designates the solution the value of the solution appears.

# Design for Coherence: Multimodal Instructional Sequence

## Traditional aspects

1. Mathematical processes: Modeling, manipulating, Reasoning. communicating
2. Type, Size, modes of communication, openness, difficulty: exercise, investigation, essay
3. Scaffolding

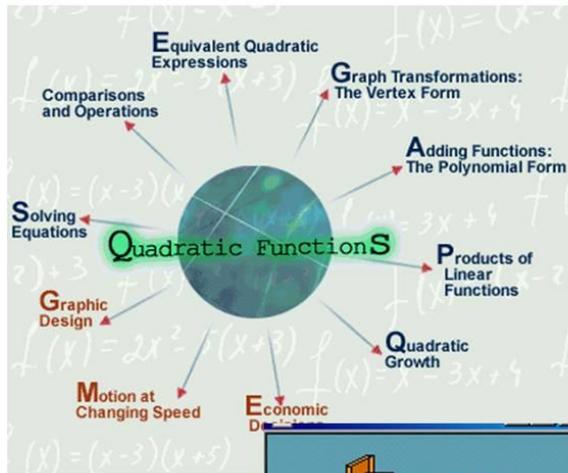

## Multimodal aspects

- Traditional text page offers clear way to follow
- The interactive page requires from the reader to order & often it takes its logic from visuals

Tools' space

# Balanced Sequence of Tasks

**TOOLS**

- Representation of functions
- Representation of parametric families
- Representation of points
- Functions on intervals
- Function fitting
- Transformations
- Representation of comparisons
- Binary calculator
- From function to Change
- Spreadsheet

## Graph Transformations: The Vertex Form

This activity involves operations which change a function by changing its graph: these operations are called **transformations** of the graph. Using transformations, we can start from one function and generate a family of functions which share some common features.

The dynamic figures below are meant to give a "feel" for transformations. In these figures you can translate and stretch graphs to get new graphs. In the first figure, when you point to the graph and the cursor changes from "arrow" to "hand", you can translate the graph in various directions. In the second figure, when you point to the graph and the cursor changes from "arrow" to "hand", you can stretch the graph horizontally by making horizontal motions with the cursor, or vertically by making vertical motions.

**Translation**

**Stretching**

The following dynamic figure presents families of functions which are generated by translations or stretching. By choosing the type transformation and using the "transform" button, you can generate different examples of such families.

**Families generated by transformations**

**Activity Tools**

- Translations
- Stretching
- Transformations of  $f(x)=x^2$
- The Vertex Form

**Tasks**

- Passing between functions
- Changing a function
- Families of functions
- Product Form and transformations
- Constructing functions by transformations
- Transformations of  $f(x)=x^2$
- The Vertex Form
- Constructing correspondence
- Converting to Vertex Form
- Pizza prices
- Tag

**Exercises**

- Exercise 1
- Exercise 2
- Exercise 3

# Design of Representation/Feedback

**Tasks**

- At the gas station
- Different prices
- Cab fares
- Changing grades
- Fuel efficiency
- Postal rates
- Inverse machines
- Graphs describing motion**
- Trucks
- Medical prescriptions
- Height and bone lengths
- Dividing a budget
- Electric bill
- Constructing functions

**Exercises**

- Exercise 1
- Exercise 2
- Exercise 3
- Exercise 4
- Exercise 5

**Representations of linear functions**

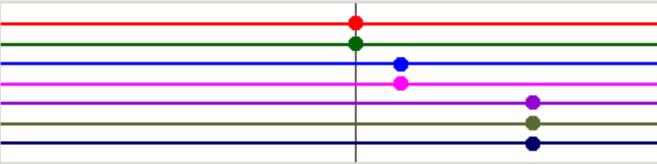

## Graphs describing motion

The first dynamic figure is a simulation of seven cars on the road. The second figure presents graphs of functions describing the dependence of the positions of the cars on

Fit the graph that describes the motion of each car. Describe the considerations that help you reach your conclusions.

## Solving Equations

How can you find solutions to equations?

You can use graphs and value-tables. You can also employ algebraic methods: modify an equation to obtain another equation with the same solutions as the original (an **equivalent** equation), but with an easier-to-read solution. For example, the linear equation  $3x+1=x+9$  is equivalent to the equation  $2x=8$ , which has an easy-to-read solution. This activity is about solving quadratic equations using algebraic methods.

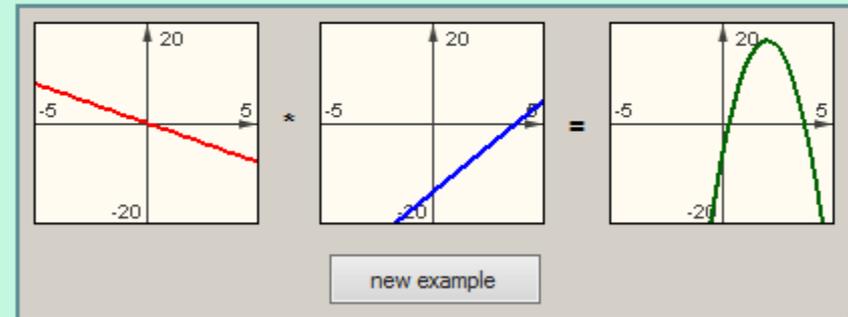

Some of the tasks in this activity suggest ideas related to **finding** the solutions of quadratic equations.

Other tasks present several problems that can be solved more easily by **constructing** quadratic equations and solving them.

### Prepare a report on solving quadratic equations

- Explain how to solve various quadratic equations.
- Give examples of equations and show how you solve them. In your examples, display cases that are different both in the form of the equation and in the number of solutions. Use the tasks and exercises in this activity if you need ideas for various forms of quadratic equations.
- Show how you check and verify your results.
- Do you think that you have a general method for solving any quadratic equation? If you think you do, explain what it is. If not, give examples of equations that you find problem
- Compare methods of solving equations by algebraic processes with methods of solving equations using graphs or value tables.

The dynamic figure below presents graphic examples of linear functions and of their product function.

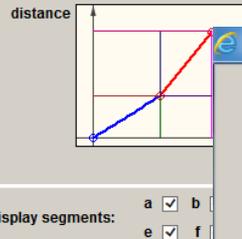

## Definition

Functions defined on intervals  
**Journeys at two speeds**

# Tools' space

The graph above represents a journey taken by a group of bike riders who rode at a constant speed for some time then increased their speed and continued at a constant speed for more. The graph is **schematic**: it gives a general description but does not contain quantitative information about time intervals, distances, or speeds. The figure also presents various segments. Display them and try to understand the meaning of the length of each segment in terms of the bicycle journey.

Among the many different journeys that the schematic graph can describe are each of the three days of the camping trip taken by the group of riders:

Day 1	Day 2	Day 3
The ride lasted 3 hours. During the first hour they rode at 15 kph, then increased their speed to 20 kph.	The route was 99 km long. In the first 3 and a half hours they rode at 18 kph, then increased their speed to 24 kph.	The route was 80 km long and the ride lasted 4 hours. At first they rode at 15 kph, then increased their speed to 20 kph.

**Construct descriptions of the rides**

The schematic graph can represent each of the rides above, but more precise descriptions are needed to show the differences between rides on different days.

- Present functions that describe the dependence of the distance on time for each of the three days. Use the **Journeys in two parts** and the **Representing motion at several speeds** tools.

# A semiotic approach for the Design of Tasks: Interactive Diagrams

A **diagram** is a representation, visual and other, containing clarifying or demonstrating information

A diagram that presents specific information presents a point of view thus **implicitly engaging** the viewer in meaningful interpretations

An **interactive diagram** (ID) is built around a pre-constructed example

The Interactive Diagram **requires from the viewer to take action** and change the diagram within given limitations

An ID differs from an **interactive tool** in that it is built for a specific task and contains a complete example

# The framework:

## Visual semiotic analysis of ID functions

I adopted a framework developed by semiotic research of text and visuals and provided categories that would allow an orderly discussion of the differences between the traditional page in math textbooks and the new page that derives its principles of design and organization from the screen and the affordances of technology (Yerushalmy 2005)

### The presentational function

Random examples  
Specific examples  
Generic examples

### The orientational function

The IDs is designed to be a sketch and/or a source of accurate information

### The organizational function

Illustrating IDs  
Elaborating IDs  
Narrating IDs

# Design decisions: The 3 organizational functions

The design of an *Illustrating IDs*

one representation and the minimal necessary control for operating with it

The boundaries that we used in *Narrating IDs'* design were:

(a) a well articulated examples

(b) support for the preferred solution path

(c) small number of representations and possibilities of elaboration

The important components in the design of the *Elaborating IDs*

rich tools and linked representations that enable various directions in the search for a solution

# Comparative micro analysis of three series of activities

	Manipulating	Modeling	Formulating
Illustrating ID			
Elaborating ID			
Narrating ID			
Paper diagram			
Video clip			

# Modeling: Comparative Microanalysis of Interaction components

**Table 1** Comparative view of the interaction components of the two IDs

	Illustrating diagram	Elaborating diagram
<b>Animation</b>		
Motion control	“Run” “Stop” “Initialize”	“Run” “Stop” “Initialize”
Information choice	Not available	Choice of activated runners
<b>Representations</b>		
1D graph of activated runners	Not available	Discrete traces on running track
2D graph of activated runners	Not available	Hotlink animated motion to graph Manual dragging and marking Time and distance information
Numeric information	Non-linked table of distances at 6 positions	Table of distances linked to traces Time and distance created and displayed along the run Hot-linked timer Hot-linked active row
<b>Links</b>		
Links between representations	Not available	2D graph and animation 1D graph and animation 1D and 2D graphs, color coded Table, 2D graph, and animation

# Formulating: Comparative Microanalysis of Interaction components

	Illustrating ID	Elaborating ID	Narrating ID
Examples			
Appearance of the example	Example appears as a graph line	Example appears as a graph line and its table of values	Example appears as two lines: a target graph (red graph) line and another graph (blue graph) line that reflects the changing parametric expression
Interaction with the example	View	View and add your own	View, change, and compare
Representations and tools			
Graph	A sketch that can be made accurate graph	A sketch that can be made accurate graph	A sketch that can be made accurate graph
Graph tools	Revealing the coordinates of points	Revealing the coordinates of points Change scale	Revealing the coordinates of points Change scale
Algebraic expression	Not available	Function expressions in any format hot-linked to a graph and a table of values (up to 3 simultaneous expressions)	Function expression and parametric expression in the form: $f(x) = a(x - c) + m$ hot-linked to a graph
Algebraic expression tools		Free syntax input of function expressions	Changing values of parameters of the given parametric expression
Table of values	Not available	A given table of $(x, f(x))$ . Hot-linked to point in the graph. Values spread homogeneously according to a specified scale and specified $\Delta x$	Not available
Table of values tools		Control $\Delta x$ Input any $x$ value and read $f(x)$ values	

# Research goals & design

- What are the characteristics of solving tasks which are presented as text with IDs?
- How do the characterizations of processes vary in accordance to the three designed organizational functions of IDs?

	Student A	Student B	Student C	Notes
Stage A		The preliminary task		The same task
Stage B	illustrating ID	narrating ID	elaborating ID	One of 3 comparable tasks
Stage C	Students assembled in a group and were asked to describe the technique they used in their solution, to present their use of the diagram, to reflect upon their moves and to be involved in a conversation regarding other students' techniques			

# How do the characterizations of processes vary in accordance to the three designed organizational functions of IDs?

## Illustrating IDs

Can be helpful in consolidating relevant knowledge

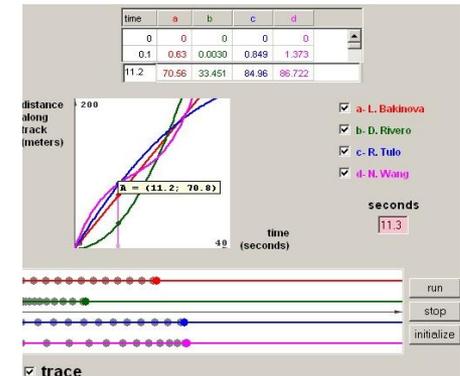

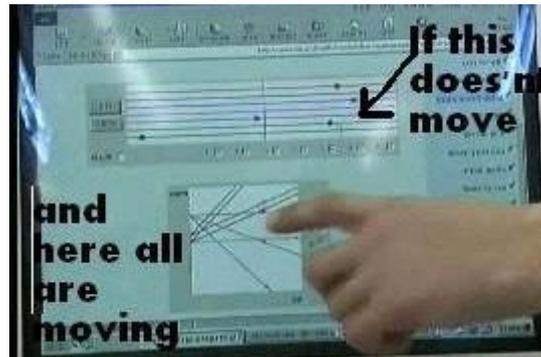

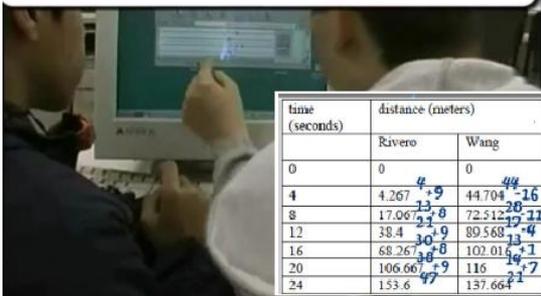

## Narrating IDs

Can be a form of instruction toward development of new scientific concepts

## Elaborating IDs

Leading to different problem-solving processes and a variety of solutions

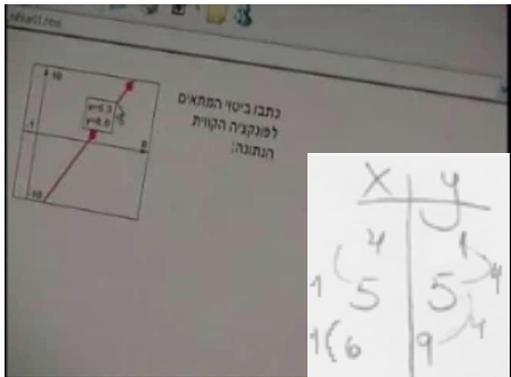

Wang is third place, who is starting to slow down.

# How do the characterizations of processes vary

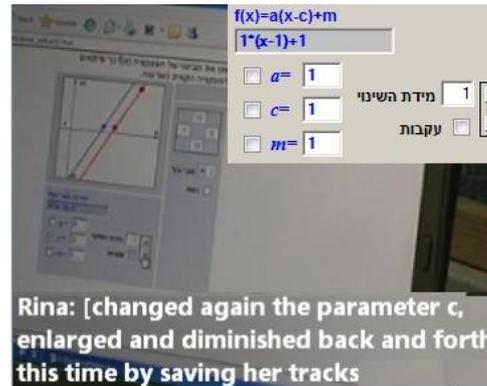

## Illustrating IDs

Can be helpful in consolidating relevant knowledge

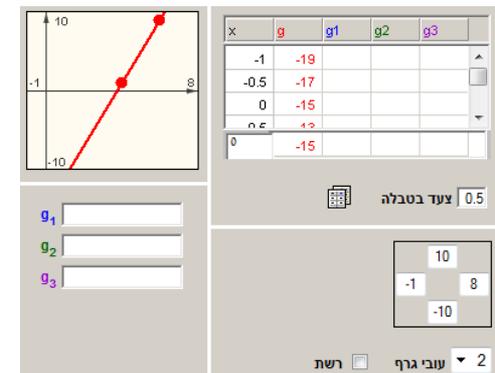

## Narrating IDs

Can be a form of instruction toward development of new scientific concepts

## Elaborating IDs

Leading to different problem-solving processes and a variety of solutions

What are the characteristics of activity consisted of reading and solving tasks which are presented as text with IDs?

## Major Finding

Personalization of the text

Unfolding the representativeness of the ID's example as carriers of the general meaning

Development of mathematical principal ideas within the boundaries designed in the IDs

## Personalization of the text

Three patterns of personalization of the text:

- (a) attention to details in the given example resulting in the construction of additional details to the original example
- (b) changing the given example, generating new examples
- (c) rephrasing the question of the task, posing new question

## Unfolding the representativeness of the ID's example as carriers of the general meaning

Two settings in which an example served to start the investigation and the processes of unfolding the representativeness of the examples:

- (a) Changing a given example by generating similar or new examples
- (b) Interacting with components of the given examples (the representations, as well as the linking and control tools)

The study highlights the common features that support the processes in each setting and highlights differences and makes distinctions in the processes which are rooted in part in the compared design variations

## Development of mathematical principal ideas within the boundaries designed in the Narrating IDs

- (a) Narrating IDs can be a form of instruction toward the development of new mathematical knowledge for students
- (b) Narrating ID designs limit the student's action and so support guidance, and at the same time remain an open space for student ideas
- (c) The NID organized and directed the process of development of the students' knowledge but the students controlled the task and were empowered by the changes they chose to make in the presentation of the task and by formulating new questions
